

Deterministic model changes at the full-IC joint MAP
Same parameters, frozen EZmock1000 covariance

Measured shuffled - reference changes: one halo and two EZ mocks
Qualitative check only; C_single is not the paired covariance

Separate global prescription changes from additional radial IC
Common full-IC joint MAP; fixed Poisson and existing sn0 included

Bias constraints: median with 68% interval; crosses mark MAP
EZmock1000 C_single, Hartlap likelihood and Percival intervals
